Steven Hudson

Software Engineer

steven.g.hudson@gmail.com (334) 750-6216 linkedin.com/in/steven-g-hudson

Profile Summary

Backend Software Engineer with experience designing scalable microservices and REST APIs, with hands-on exposure to large language models, prompt engineering, and agentic AI systems. Contributes throughout the SDLC from design and development through production deployment, monitoring, and operational support. Strong problem-solving skills with a track record of improving code quality, system performance, and operational stability.

Technical Skills

Programming Languages	Python, Java, TypeScript, SQL, C#
Frameworks & Libraries	Flask, Django, Node.js, React, Pytest, Selenium, REST APIs
Dev Tools	Git, Claude Code, Docker
Cloud & DevOps	Azure DevOps CI/CD, Kubernetes, Kafka, Azure EventHubs

Experience

AI Trainer (Contractor), DataAnnotation - Austin, TX Jan 2026 - Present

- Apply prompt engineering techniques to create and refine inputs for large language models (LLMs) and coding agents against open source repositories, evaluate responses with awareness of model limitations, and provide targeted feedback to improve accuracy and relevance of AI-generated code
- Analyze and edit agentic AI workflows including tool calls and reasoning chains to validate output accuracy and alignment with engineering standards, applying responsible AI practices including awareness of data privacy and ethical use

Software Engineer, General Motors - Austin, TX Jan 2022 - Aug 2025

Energy Partner Portal

- Owned end-to-end delivery of client-facing customer enrollment and charge management flows for a cloud-native electric vehicle home charging platform
- Collaborated with cross-functional teams and utility partners in an Agile environment to coordinate electric vehicle charging management according to grid demand
- Enhanced performance using event-driven architecture across distributed REST-based microservices, reducing enrollment latency from 12s to under 2s
- Participated in code reviews and drove adoption of unit testing with Pytest and analysis with SonarQube, increasing code coverage from 0% to nearly 90% and improving code quality across 5 microservices

Home Charging Installation

- Improved reliability of a distributed Java service by performing root-cause analysis on production issues and refactoring to eliminate deadlocks and enhance multithreading performance
- Restored developer productivity by analyzing support ticket trends and implementing features that empowered representatives to resolve common issues without escalation to development team

Education

B.S. Software Engineering May 2021

Arizona State University, Tempe, AZ Magna Cum Laude

Projects

Galactic Waez Oct 2021

- Reverse-engineered game memory structures and implemented A* pathfinding to optimize navigation across 20k+ nodes, demonstrating low-level debugging, understanding memory models, and algorithm design

Performance Scheduler Jan 2020

- Designed and developed a desktop Java application with custom UI components to facilitate movie theater scheduling with an intuitive, drag-and-drop interface and reinforcing object-oriented design and end-to-end app development
